Southern Water strengthens waste water management with upgrade of their 'V' logging systems

Southern Water has once again looked towards IEA to strengthen the management and monitoring of tanker hauled waste into their sites. Another 12 new V6 loggers are now live across the region.

Eight of these systems are monitoring intersite sludge movements allowing Southern Water to report on the quantity and quality of product received from smaller satellite works. Three of the V6 systems have been installed at Aylesford, Canterbury and Chichester to manage the receipt of domestic waste from private haulers.

A further V6 system has been installed at Aylesford to manage the intake of trade waste to the site. This is the first V system installed in Southern Water specifically for use of monitoring this type of effluent.

The introduction of V technology for this application reiterates Southern Water's belief in benefits brought to their business by the IEA 'V' product family.

The system records the details of discharges and automatically channels the waste into one of the three holding tanks as selected by the site supervisor.
